How to make full size patterns.

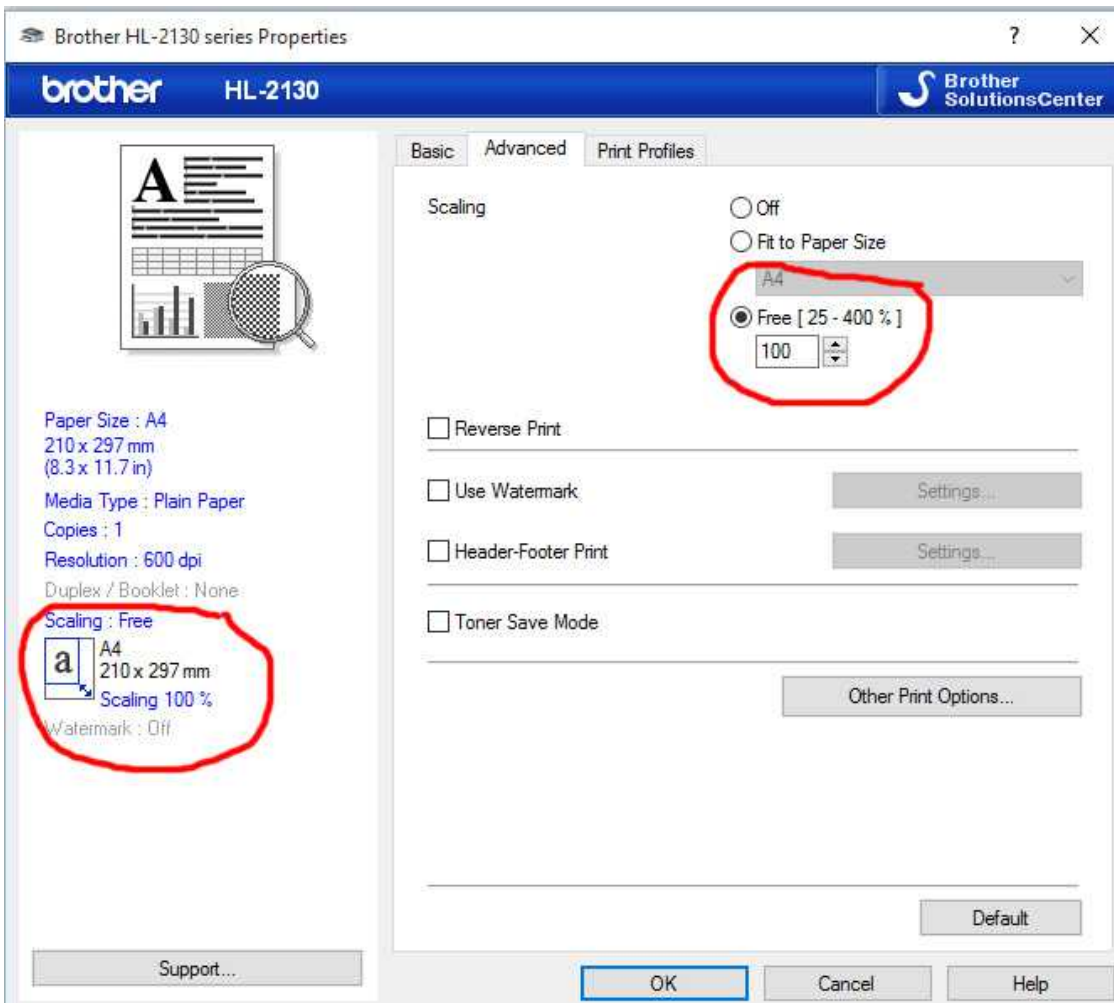

How to print and join the pages to make full size paper templates for your woodworking projects.

Step 1

How to print the PDF file you have downloaded.

These plans are made to fit an A4 sheet of paper. It is important to print the plans at a 100% scale.

This is an example of a Brother HL-2130 printer. This page is accessed through the Properties tab.

Example: Print 100% scale

Step 2.

How to join two or more sheets of paper to make a full size paper template.

In the days before digital media, in drawing offices we would use a light table to create and modify plans.

Today, this is still a useful skill, but not many people have access to a light table. Instead we can use a conveniently located window.

Attach the first sheet to the window as shown above.

Carefully line up the second sheet to the “join here” line shown dotted on the plan.

With a sharp knife, carefully cut along the “join here” dotted line, making sure that you cut through both sheets.

Note the photo is showing a freehand cut, this is because the cut does not have to be absolutely straight as long as the two sheets match.

Remove the waste, apply sticking tape along the cut and viola! You now have a full size paper template.
